

Minimal HW

Problem 1: Sigma Notation

$$S = 5 + 9 + 13 + \dots + 89$$

$$a_1 = 5 \text{ and difference } d = 4$$

$$a_n = a_1 + d(n - 1)$$

Let's fit a_1 and d values into equation:

$$89 = 5 + 4n - 4$$

$$88 = 4n \rightarrow n = 22$$

$$\text{Answer: } S = \sum_{k=1}^{22} 5 + 4(k - 1)$$

Problem 2: Shifting Index in Sigma Notation

$$\sum_{k=3}^{15} (2k + 1)$$

$$\text{start at } k = 1 \text{ then } \sum_{k=3-2}^{15-2} (2(k + 2) + 1)$$

$$\text{Answer: } S = \sum_{k=1}^{13} 2k + 5$$

Problem 3: Recursive Notation

$$a_1 = 12 \text{ and } a_n = a_{n-1} + d.$$

$$\text{if } a_{10} = 57 \text{ then } d = \frac{57-12}{10-1} = 5$$

$$\text{Answer: } a_{25} = 12 + 5(25 - 1) = 132$$

Problem 4: Applied Problem

if we check the first and last multiples of 7 then we can easily find d and the sum.

The first multiple above 100 is 105 where 7×15 since 100...104 are not multiples of 7.

The last multiple below 1000 is 994 where 7×142 since 1000, 999, 998, 997, 996, 995 are not multiples of 7.

$$n = \frac{a_n - a_1}{d} + 1 \rightarrow \frac{994 - 105}{7} + 1 = 127 + 1 = 128$$

$$\text{Answers: } S = \frac{a_1 + a_n}{2} \times n = \frac{105 + 994}{2} \times 128 = 1099 \times 64 = 70336$$

Problem 5: Sigma notation

$$2650 = \sum_{k=1}^n (3k + 2)$$

$$S = \frac{a_1 + a_n}{2} \times n \text{ and } a_1 = 3 \times 1 + 2 = 5, a_n = 3n + 2$$

$$S = \frac{5 + 3n + 2}{2} \times n \rightarrow 5300 = n \times (3n + 7)$$

$$3n^2 + 7n - 5300 = 0 \Rightarrow D = 49 + 4 \times 3 \times 5300 = 63649$$

$$n = \frac{-7 \pm \sqrt{63649}}{6} \approx 41$$

Check if n satisfies the $S = 2650$

$$S = \frac{5 + 3 \times 41 + 2}{2} \times 41 \rightarrow 41 \times 65 = 2665 \text{ slight larger than } S$$

Check if $n = 40$ satisfies the $S = 2650$

$$S = \frac{5 + 3 \times 40 + 2}{2} \times 40 \rightarrow 20 \times 127 = 2540 \text{ less than } S$$

Answer: there is no n such that $S = 2650$

Problem 6: Mean Formula

$$a_{10} = a_1 + 9d. \text{ Let's find } a_1 \text{ and } d$$

$$a_5 = a_1 + 4d \text{ and } a_{15} = a_1 + 14d$$

$$a_{15} - a_5 = 10d \rightarrow 60 - 20 = 10d \rightarrow d = 4$$

$$\text{Answer: } a_{10} - a_5 = 5d \rightarrow a_{10} = 20 + 20 = 40$$

Problem 7: Applied Problem

$$a_{20} = a_1 + 19d \rightarrow a_{20} = 5 + 19 \times 0.5 = 29/2$$

$$\text{Answer: } S = \frac{a_{20} + a_1}{2} \times n \rightarrow S = \frac{29/2 + 5}{2} \times 20 = 10 \times (14.5 + 5) = 195$$

Problem 8: Sum of the First N terms

$$a_1 = 11 \text{ and } d = 3$$

$$1000 = \frac{11+a_n}{2} \times n \rightarrow 2000/n = 11 + a_n \rightarrow 2000/n = 11 + a_1 + 3 \times (n-1)$$

$$2000/n = 22 + 3n - 3 \rightarrow 2000/n = 19 + 3n$$

$$3n^2 + 19n - 2000 > 0$$

$$\text{Answer: } n = \frac{-19 \pm \sqrt{19^2 - 4 \times 3 \times -2000}}{2 \times 3} \approx \frac{-19 + 156}{6} \approx 23$$

Problem 9: Shifting Index in Sigma Notation

$$\sum_{k=3}^{12} 4\left(\frac{1}{2}\right)^k \text{ find } S \text{ starting from } k = 0$$

$$\sum_{k=3}^{12-3} 4\left(\frac{1}{2}\right)^{k+3} \rightarrow \sum_{k=0}^9 4\left(\frac{1}{2}\right)^k \left(\frac{1}{8}\right)$$

$$\text{Answer: } \sum_{k=0}^9 \left(\frac{1}{2}\right)^k \left(\frac{1}{2}\right)$$

Problem 10: N-th Term Formula of geometric sequence

$$a_2 = a_1 r \text{ and } a_5 = a_1 r^4$$

$$\frac{48}{-6} = r^3 \rightarrow r = -2$$

$$\text{Answer: } \frac{a_{10}}{a_2} = r^8 \rightarrow a_{10} = -6 * (-2)^8 = -1536$$

Problem 11: Finding Common Ratio

$$\text{Answer: } \frac{a_7}{a_4} = r^3 \rightarrow \frac{1458}{54} = r^3 \rightarrow r = 3$$

Problem 12: Sum of the First N terms

$$S_n = a_1 \frac{1-r^n}{1-r}$$

$$\text{Answer: } S_{15} = 8 \times \frac{1-(3/4)^{15}}{1-3/4} \approx 8 \times 4 = 32$$
